90% right per step. *59%* after five.

Why I split every AI job into small, checked steps. Swipe through.

Vaibbhav Sutar

One prompt, *five* jobs inside

Find the facts.

Write the draft.

Format it.

Check it.

Send it.

You asked once. The AI ran five steps.

59%

Example: each step *90%* right.
Five steps: 0.59.

How I *split* a job

1. One step, one job
2. Check it before the next step
3. Repeat work goes to a script
4. Fix the broken step, not the run

But *more* steps is not the fix

Ten unchecked steps at 90% is 35%.

The check is what saves you.

A step you check gets fixed before the error spreads.

Check *each* step, not just the end

Small steps you can check beat one big prompt you can only hope about.
